## TURKS AND CAICOS ISLANDS

## FOREWORD

*The Statistical Unit in the Strategic Policy and Planning Department is pleased to present the Preliminary **Vital Statistics Tables for 2014**. This is a release in the series of publication on the Turks and Caicos Island basic demographic characteristics. Included in these tables are indicators of births, deaths and marriages for the years 2014, with inclusion of data from 2001 to 2013 for comparative purposes.*

*The Vital Statistics tables is an initiative of the Department in response to the need for the availability of important indicators in assessing selected characteristics of a country's population and inputs to social planning and economic development. Basic data are sourced from the Hospitals, NHIP, Courts and the Civil Registrar's Office. Other supporting data are obtained at various government departments and offices responsible for the recording of specific cases and occurrences. The Statistical Department validates and processes these data and presents the information in a set of structured statistical tables.*

*It is hoped that these tables will continue to be an insightful tool to social and economic planners and policy makers, as well as general users of vital statistics. Any comments and suggestions that may help to improve this or any of our other publication are welcomed.*

**Shirlen Forbes (JR)**

**Chief Statistician**

## ***Acknowledgements***

The Statistical Unit of the Strategic Policy and Planning Department would like to acknowledge the contribution of the following persons and Offices which have contributed in one way or another to the successful completion of this publication, whether it was the collection source or facilitated submission of the required data.

Ms. Juneth Reynolds, Medical Records Manager, Medical Records Section, Cockburn Town Medical Center

Ms. Vanessa Virgil, Medical Records Section, Cockburn Town Medical Centre

Ms. Vanessa Forbes, Medical Records Section, Chesire Hall Medical Center

Ms. Strudy Lightbourne, Medical Records Section, Chesire Hall Medical Center

Ms. Sigrid Lightbourne, Registrar General, Office of the Registrar General

Ms. Bernadette Williams, Registrar, Office of the Registrar General (Providenciales)

Dr. Maitland and Miss Kendra Malcolm from the epidemiology Unit

Miss Romain Missick NHIP

The Courts Office

The contribution of the Staff of the Statistical Office cannot go unmentioned for their dedicated effort expended in compiling and processing the data, and preparing the tables.

## **TECHNICAL NOTES**

### ***Methodology***

The main units/subjects of analysis were births, deaths, marriages and divorces. These were examined by various socio-demographic characteristics (for example, sex, age groups, months and years, and nationality) across the various geographic areas (islands) and over the period 2001 to 2014, with comparisons of 2013 and 2014.

Data for births and deaths were extracted from “Births Returns” and “Death Certificates”, respectively recorded by the Medical Records Section of Hospitals and cross-checked with records housed at the Civil Registrar’s Offices in Grand Turk and Providenciales.

Marriage data was obtained from marriage certificates archived at the Civil Registrar’s Office.

Other supporting vital statistics data were obtained at various government departments/offices, responsible for the recording of specific cases and occurrences like Primary Health Care Unit and court office.

The Statistical Office collects the files from these various sources and services data-users by cleaning, verifying, and processing the data using MS Excel and Statistical Package for the Social Sciences (SPSS) to ease tabulation and collation and prepares the report for publication.

### ***Scope and Limitations***

The Statistical Office gathers all data in whatever format available (soft or hard copy). At present there are still some offices without existing proper databases maintained. Thus statistics in most cases are not readily available concerning these types of vital events. Furthermore, there are still other significant information which can be captured from the latest Birth Return Form (e.g. type of delivery, mother’s pregnancy history, marital status, and educational attainment of mother, etc.) that were not included in this report. In some cases, these new items were left unfilled by the staff preparing the forms (Birth Return or Death Certificates). There are also cases where there are completely no information including the person’s gender on births and deaths. It would be best if all updated data capture forms would be implemented properly or more information would be available on births, deaths, marriages, and divorces to enhance the findings and analysis of this report. Overall however, the vital statistics data included in this report is of good quality, accuracy, and reliability.

*Population  
&  
Vital  
Statistics  
Summary*

## Vital statistics summary

*This section of the publication presents highlights of analysis of the estimated population and other vital indicators of live births, deaths, marriages, and divorces for the Turks and Caicos Islands (TCI) for the period 2001 to 2014. It should be noted that the main focus of this publication is on events that physically occurred and was recorded in the Turks and Caicos Islands.*

The Turks and Caicos Islands has experienced unprecedented population growth over the last twenty years due largely to the immigration of people from neighbouring countries seeking employment created by the development of tourism industry. Between 1980 and 2012 the population of the islands increased four-fold from approximately 7,400 to 31,500. Since 1990 average annual immigration has moved from 255 to just over 800. The focus of the growth in population over the twenty years has been the island of Providenciales. Whereas, in 1990 Providenciales accounted for 42% of the population of the Turks and Caicos with a population of 4,821, by 2012 the share had increased to 75% with a population of 23,769. This island accounted for 94% of the growth of just over 20,000 to Turks and Caicos between 1990 and 2012. Such rapid population changes for this small island group present many social, economic, environmental and political challenges. Life tables constructed for the intercensal period 2001-2012 show life expectancies of 77.3 years for women and 75.1 years for men at 2001. By 2012, 0.7 years had been added to the males and 0.5 years to the females yielding life expectancies of 75.8 years and 77.8 years respectively for males and females. Among female Belongers those with the highest fertility at both periods were 20-29 years old while for the Non-Belongers those with the highest fertility were between 25 and 34 years. In 2001 more than one half (about 58%) of births occurred to Belonger women between the ages of 20 and 34 years. By 2012 a slightly lower 57% of births were to Belonger women in this age group. Among Non-Belonger females it was in the older age group of 25-34 years that the majority (over 60%) of births occurred; 64% in 2001 and 60% in 2012. There is evidence of delayed childbearing as the median age at birth increased by one year for Belonger women from 25 years to 26 years and by a small 0.3 years for Non-Belongers between 2001 and 2012.

When analyzing the live births in the TCI the data shows that from 2001 to 2014, the number of live births increased significantly. Whereas in 2001 only 271 live births were recorded, in 2014, 437 live births were recorded in the Turks and Caicos Islands. The highest births (596) in the country were recorded in 2009 when compared to the previous years. Crude birth rate for this year also confirmed this result. As was the case with previous years, more than half (54%) of the live births in 2009 were to Haitian mothers. CBR in 2009 was 16.6 live births per thousand populations. In 2014 the CBR was 12.4%. A summary analysis of the live births between 2001 and 2014, as seen in table 9 shows that whereas 47.2% of the total live births during this period were to Haitian mothers, only 27.2% of the total births during this period were to TCI mothers.

The number of deaths in the TCI has an observable fluctuating trend over the years. The highest number of deaths of 116 and 117 was recorded in 2007 and 2011. This significant increase in the number of deaths in 2007 was primarily due to a Haitian sloop disaster which happened very close to Providenciales in that year and posted more than 60 deaths. A similar disaster resulting in less deaths occurred in 2011. From 2007 to 2008, the number of deaths however went down by 44%. The crude death rates were relatively lower compared to the crude birth rates. In 2012 the number of marriages in the country, 418 was lower in comparison to the previous years. This could be as a result of more residents choosing overseas wedding destinations

and the TCI attracting less overseas couples as other destinations became more attractable. It should be noted that over the period 2001 to 2013 more than 90% of these total marriages were to non-TCI nationals, temporary residents, or visitors to the Islands.

The percentage of divorces that are classified as “final” increased during the period 2011 to 2013. During this period more than 70 percent of divorces filed were finalized. The year 2008 marked the lowest number and percentage of divorces completed (8 or approximately 14%) for the period 2001 to 2013. This was partly due to the delays in the divorce proceedings that happened in that year as a result of problems with courtroom space.

Notes:

<sup>1</sup>The figures exclude deaths of the islands' population which take place outside of the country.

\* The figures do not include births to residents outside the TCI.

Included in this calculation are the death of immigrants from Haiti in TCI waters.

Note: Based on life table relating deaths for a five year period centering on the census year, using the U.S. Census Bureau PASEX.XLS worksheet LPOPTDH.

A close-up, blue-tinted photograph of a computer keyboard. The keys are slightly out of focus, with some keys like 'E', 'D', and 'S' clearly visible. The word "Births" is overlaid in the center in a stylized, blue, serif font with a slight shadow effect. The background is a solid blue color.

*Births*

This section presents live births statistics in the TCI from 2001 to 2014 and other information on the mother such as: age, nationality and island of usual residence. It should be noted that live births considered in this report cover mainly those that have occurred in the Islands and not overseas. It also only captures those births which occurred in the hospitals or if it occurred outside the hospital was registered at the Registrar of Births Office. The figures for 2011-2014 are provisional.

*Deaths &  
Diseases*

*This section presents the number of deaths in the country for the period 2003 to 2014. The term “older person” or “older population” was also used in this section to refer to elderly persons, 60 years and older. According to the World Health Organization (WHO), there is no standard numerical criterion as a definition for older person but the United Nations’ agreed cutoff is 60+ years old.*

Over the years, the number of recorded deaths in the TCI fluctuated. The highest recorded death figure in the TCI was in 2011 where there were 117 deaths or 44.4% increased from 2010. Included in this figure was the drowning of 10 Haitian migrants in our waters. Previously the highest recorded death figure in the TCI was in 2007 when 116 deaths or 59% increased from 2006. This was mainly because of the Haitian migrants’ sloop disaster in May 2007. A boat full of migrants sank off the coast of Providenciales and registered more than 60 deaths. Similar incidence of these drowning’s of Haitian boat people were recorded in 2009, 2011 and 2013 when 15, 10 and 17 deaths were recorded respectively. Meanwhile, the number of deaths within the country (76) declined in 2014 from 101 in 2013. For the period 2003 to 2014, the lowest number of deaths (46) was recorded in 2004. In addition, with the exception of 2011 when there were more female than male deaths, from 2004 to 2014, the number of male deaths was higher than female deaths. In 2014 there were 26 female deaths and 50 male deaths.

The lowest overall CDR in the period 2001 to 2014 was in 2007 at 1.6 deaths per thousand persons while the highest can be observed in 2001 at 3.47 deaths per thousand persons. Except in 2007, approximately half of the total number of deaths was among the older population or those in the 60 years old or up age group from 2003 to 2014. Higher number of deaths in the older population can be noted specifically at the 80 years and above age bracket. The highest number of deaths in the older population can be noted in 2011, 2012 and 2013. July was the peak month in records of death in 2014 with the result of the Haitian boat disaster mentioned earlier. The lowest number of deaths in 2014 was recorded in the month of November.

By nationality, the largest percentage of deaths in 2014 were to Islanders (46% or 88 deaths) followed by Haitian nationals (18% or 23 deaths). In the absence of personal identifications, it could be observed that the age of a significant proportion of deaths that were to Haitians (38%) appeared to be unknown in 2013.

**CHART 13. DEATH BY NATIONALITY WITHIN THE TCI, 2014**

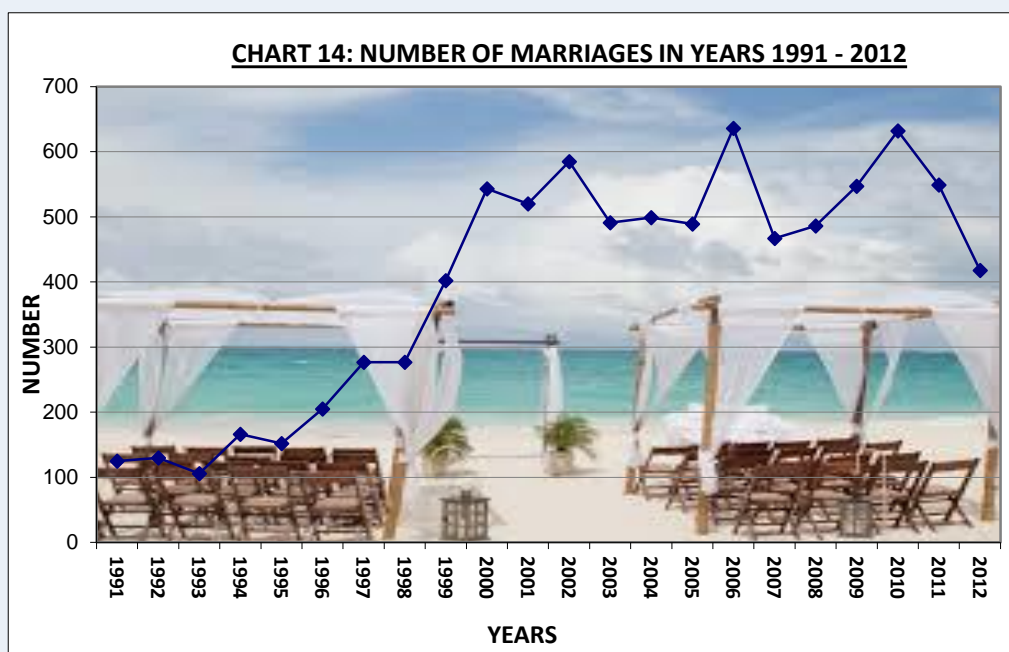

*Marriages*

## ANALYSIS OF MARRIAGES IN THE TCI FROM 2001 TO 2012

This section provides an analysis of marriages within the TCI from 2001 to 2012. Although detailed data is not available for 2011 and 2012, it should be noted that based on previous yearly trends, over 80% of marriages performed in the TCI occur to visitors or non-residents who leave shortly after they wed and have no impact on

the country's demographic or social climate. Hence, not much analysis was done on this section of the publication. Data from the civil registry however reveal that a total of 418 marriages were registered in 2012 compared to

549 marriages in 2011 (Chart 24). It should be noted that for the period 2004 to 2012 the month of May recorded the most marriages in the TCI. Since 1999 the number of marriages in the TCI has constantly been over 400. The highest number of marriages during the period 1999 to 2012 was recorded in 2006 and 2010 when 636 and 632 marriages were recorded respectively.

When broken down by nationality, Table 29 shows that 67% of brides and 66% of grooms hail from the United States of America in 2010. In the same year TCI brides and grooms accounted for 6% and 4% respectively. It should be noted that as with the other events in the TCI, many islanders choose the USA and other countries as their wedding destination. Those events that occurred outside of the country were not captured in these tables. Table 30 reveals that in 2010 the majority of TCI grooms got married to TCI, Dominican and Haitian brides. 42% of marriages of TCI grooms were to TCI brides, 27% were to Dominican brides and 23% were to Haitian brides. The rest were allocated to other nationalities. The majority of marriages of TCI brides, 28.2%, were to TCI grooms, while 25.6% were to Haitian grooms, 15.4% were to Jamaican grooms, 12.8 were to Dominican grooms and the other were to different nationalities.

**Chart 18: Breakdown of Nationality of Grooms to TCI Brides 2010**

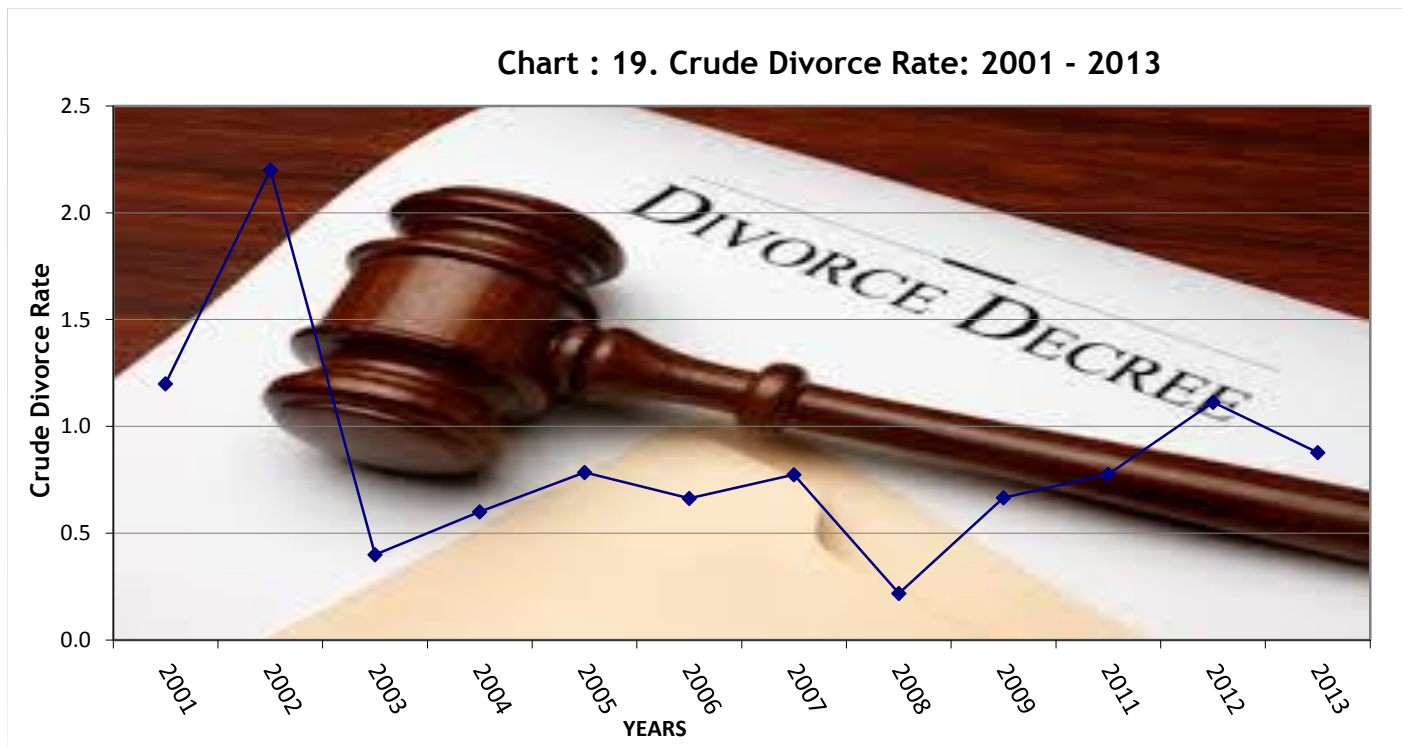

A close-up, blue-tinted photograph of a computer keyboard. The keys are slightly out of focus, with some characters like 'E', 'D', 'S', and 'C' visible. The word "Divorces" is overlaid in the center in a blue, italicized serif font. A large, solid blue circle is partially visible in the bottom right corner.

*Divorces*

*This section shows the divorce statistics in the TCI. The divorces statistics included in this report are only those that were completed with the issuance of a “Decree Absolute” by the Court. It should be noted that in the divorce process, the “Decree Nisi” is the provisional divorce order issued by Court before the “Decree Absolute”. The couple will remain married until the “Decree Nisi” has been Absolute.*

The percentage of divorces that is classified as “final” increased during the period 2011 to 2013. During this period more than 70 percent of divorces filed were finalized. The year 2008 marked the lowest number and percentage of divorces completed (8 or approximately 14%) for the period 2001 to 2013. This was partly due to the delays in the divorce proceedings that happened during the year. It should also be noted that the Supreme Court, which handles divorce applications, was moved and occupied temporary offices since their building was destroyed by fire. This was followed by Hurricane Ike in September of 2008 which led to further delays.

During the period 2001 to 2013, almost three-quarters or 75% of finalized divorces occurred after 6 or more years of marriage. Forty-five percent (45%) of the finalized divorces in 2013 occurred after 9 years of marriage. In contrast, 60% of the divorces finalized in 2012 occurred after 10 or more years of marriage. Mostly, childless couples (69 percent) or those with one child (20.7 percent) “finalized” their divorce in 2013.

**TABLE 37: NUMBER OF DIVORCES  
AND CRUDE DIVORCE RATE  
2001-2013**

YEARS	FILED DIVORCES	FINAL DIVORCES	Completion Rate	Crude Divorce Rate

# GLOSSARY

## GLOSSARY

### CRUDE BIRTH RATE

A vital statistics summary rate based on the number of live births occurring in a population during a given period of time, usually a calendar year, i.e., the number of live births occurring among the population of a given geographical area during a given year, per 1,000 mid-year total population of the given geographical area during the same year.

### CRUDE DEATH RATE

A vital statistics summary rate based on the number of deaths occurring in a population during a given period of time, usually a calendar year, i.e., the number of deaths occurring among the population of a given geographical area during a given year per 1,000 mid-year total population of the given geographical area during the same year.

### CRUDE DIVORCE RATE

A vital statistics summary rate based on the number of divorces occurring in a population during a given period of time, usually a calendar year, i.e., the number of divorces occurring among the population of a given geographical area during a given year per 1,000 mid-year total population of the given geographical area during the same year.

### CRUDE MARRIAGE RATE

A vital statistics summary rate based on the number of marriages occurring in a population during a given period of time, usually a calendar year, i.e., the number of marriages occurring among the population of a given geographical area during a given year per 1,000 mid-year total population of the given geographical area during the same year.

### DEATH

Death is the permanent disappearance of all evidence of life at any time after live birth has taken place (post-natal cessation of vital functions without capability of resuscitation). This definition excludes foetal deaths (see FOETAL DEATH).

### DIVORCE

Final legal dissolution of a marriage; a separation of husband and wife that confers on the parties the right to remarriage under civil, religious and/or other provisions in accordance with the laws of the country.

#### **FOETAL DEATH**

The death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the period of gestation; the death is indicated by the fact that after such separation, the foetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.

#### **INFANT DEATHS**

Deaths of live-born children under one year of age.

#### **INFANT MORTALITY RATE**

A vital statistics summary rate based on the number of infant occurring during the same period of time, usually a calendar year, i.e., the number of deaths under one year of age occurring in a given geographical area during a given year, per 1,000 live births occurring among the population of the given geographical area during the same year.

#### **LIVE BIRTH**

A live birth is the result of the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which after such separation breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered to be live-born.

#### **MATERNAL DEATH**

A maternal death is the death of a woman while pregnant or within 42 days after the termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes.

#### **MATERNAL MORTALITY RATE**

A vital statistics rate based on the number of deaths due to maternal causes relative to the number of live births occurring during a given period of time, usually a calendar year, i.e., the number of deaths to women resulting from (a) direct obstetric complications of pregnancy, labour and the puerperium, (b)

from interventions, omissions or incorrect treatments or their results, or (c) from indirect obstetric causes resulting from previously existing disease or disease arising during pregnancy and which was not due to direct obstetric causes but which was aggravated by the physiological effects of the pregnancy, occurring in a given geographical area during a given year per 100,000 (or 10,000) live births occurring in the given geographical area during the same year.

#### **POPULATION**

(1) All the inhabitants of a given country or area (province, city, metropolitan area etc.) considered together; the number of inhabitants of a country or area. (2) In sampling, the whole collection of units (persons, households, institutions, events etc.) from which a sample may be drawn.

#### **VITAL EVENT**

The occurrence of a live birth, death, foetal death, marriage, divorce, adoption, legitimation, recognition of parenthood, annulment of marriage or legal separation.
