FOREWORD

The Statistics Department is pleased to present the Preliminary **Vital Statistics Tables for 2019**. This is a release in the series of publication on the Turks and Caicos Islands basic demographic characteristics. Included in these tables are indicators of births, deaths and marriages for the year 2019, with inclusion of data from 2001 to 2018 for comparative purposes.

The Vital Statistics tables is an initiative of the department in a response to the need for the availability of important indicators in assessing selected characteristics of the country's population and inputs to social planning and economic development. Basic data are sourced from the Hospitals, National Health Insurance Board, Courts and the Civil Registrar's Office. Other supporting data are obtained at various government departments and offices responsible for the recording of specific cases and occurrences. The statistics department validates and processes these data and presents the information in a set of structured statistical tables.

It is hoped that these tables will continue to be an insightful tool to social and economic planners and policy makers, as well as general users of vital statistics. Any comments and suggestions that may help to improve this or any of our other publications are welcomed.

Acknowledgements

The Statistics Department would like to acknowledge the contribution of the following persons and Offices which have contributed in one way or another to the successful completion of this publication, whether it was the collection source or facilitated submission of the required data.

Ms. Juneth Reynolds, Medical Records Manager, Medical Records Section, Cockburn Town Medical Center

Ms. Vanisisa Virgil, Medical Records Section, Cockburn Town Medical Centre

Ms. Sigrid Lightbourne, Registrar General, Office of the Registrar General

Mrs. Thermala Parker, Office of the Registrar General (Providenciales)

Dr. Shandey Malcolm and Mrs. Shenika Harvey from the Epidemiology Unit

Ms. Romaine Missick-Smith, National Health Insurance Board

The contribution of the Staff of the Statistics Department cannot go unmentioned for their dedicated effort expended in compiling and processing the data, and preparing the tables.

TECHNICAL NOTES

Methodology

The main units/subjects of analysis were births, deaths, marriages and divorces. These were examined by various socio-demographic characteristics (for example, sex, age groups, months and years, and nationality) across the various geographic areas (islands) and over the period 2001 to 2019, with comparisons of 2018 and 2019. Data for births and deaths were extracted from “Births Returns” and “Death Certificates”, respectively recorded by the Medical Records Section of Hospitals and cross-checked with records housed at the Civil Registrar’s Offices in Grand Turk and Providenciales. Marriage data was obtained from marriage certificates archived at the Civil Registrar’s Office. Other supporting vital statistics data were obtained at various government departments/offices, responsible for the recording of specific cases and occurrences like Primary Health Care Unit and court office.

The Statistics Department collects the files from these various sources and services data-users by cleaning, verifying, and processing the data using MS Excel and Statistical Package for the Social Sciences (SPSS) to ease tabulation and collation and prepares the report for publication.

Scope and Limitations

The Statistics Department gathers all data in whatever format available (soft or hard copy). At present there are still some offices without existing proper databases maintained. Thus statistics in most cases are not readily available concerning these types of vital events. Furthermore, there are still other significant information which can be captured from the latest Birth Return Form (e.g. mother’s pregnancy history, and educational attainment of mother, etc.) that were not included in this report. In some cases, these new items were left unfilled by the staff preparing the forms (Birth Return or Death Certificates). There are also cases where there are completely no information including the person’s gender on births and deaths. It would be best if all updated data capture forms would be implemented properly or more information would be available on births, deaths, marriages, and divorces to enhance the findings and analysis of this report. Overall however, the vital statistics data included in this report is of good quality, accuracy, and reliability.

DEFINITION AND EXPLANATION ON VITAL STATISTICS TERMS

AGE AND SEX COMPOSITION

MEDIAN AGE: The age at which half the population is older and half is younger.

AGE DEPENDENCY RATIO: is the ratio of persons in the “dependent” ages (under 15 and over 64 years) to those in the “economically productive” ages (15-64 years) in a population. The higher the dependency ratio value, the larger the number of people outside the working age groups to be “supported by” people of working age. A good value for the age dependency ration is low value.

$$\frac{\text{Population under 15 + Population over 64}}{\text{Population 15 – 64}} \times 100$$

SEX RATIO: The Sex Ratio is the ratio of males to females in a given population, usually expressed as the number of males for every 100 females.

It should be noted that the sex ratio at birth in a number of countries are about 105 or 106 males per 100 females. After birth, sex ratios vary because of different patterns of mortality and migration for males and females within the population.

MORTALITY

CRUDE DEATH RATE: this is a basic common measure of mortality. It is defined as the number of deaths in a year per 1000 of the mid-year population.

$$\frac{\text{Number of deaths in year}}{\text{Mid- year Population}} \times 1000$$

INFANT MORTALITY RATE: tells us how many infants (under 1) who die in a given year per 1,000 births in the same year.

$$\frac{\text{Number of deaths to persons 0 to 1}}{\text{Number of live births in year}} \times 1000$$

Maternal Deaths are those caused by deliveries and complications of pregnancy, child-birth and puerperium.

MATERNAL MORTALITY RATES: this rate tells us the annual of maternal deaths per 1000 live-births in that same year.

$$\frac{\text{Number of maternal deaths}}{\text{Number of live births in years}} \times 1000$$

STILL BIRTH RATE: is the number of stillbirths per 1000 births (live and stillbirths)

$$\frac{\text{Number of still births}}{\text{Number of live births in a year}} \times 1000$$

FERTILITY

CRUDE BIRTH RATE: this rate simply tells us how many live births take place in a certain year per 1000 population.

$$\frac{\text{Number of Live Births in Year}}{\text{Mid – year population}} \times 1000$$

TOTAL FERTILITY RATE: tells us what the completed family size would be if the fertility rate behavior of a given year continued unchanged into the future. It can also be defined as the total number of children that would be born to each woman if she lived to the end of her child-bearing years and give birth to children in alignment with the prevailing age-specific fertility rates. It is calculated by totaling the age-specific fertility rates.

NET PRODUCTIVE RATE: is the average number of daughters that would be born to a woman if she passed through her life from birth conforming to the age specific fertility rates and mortality rates of a given year.

POPULATION CHANGE

RATE OF NATURAL INCREASE: is the rate at which a population is increasing (or decreasing) in a given year due to a surplus (or deficit) of births over deaths expressed as a percentage of the base population. This rate does not include the effects of migration

$$\frac{\text{Number of Births in Year} - \text{Deaths in that same year}}{\text{Mid – year population of that same Year}} \times 1000$$

NUPTIALITY

CRUDE MARRIAGE RATE: is the number of marriages per 1000 population.

$$\frac{\text{Number of Marriages in Year}}{\text{Mid - year population in that same Year}} \times 1000$$

CRUDE DIVORCE RATE: is the number of divorces per 1000 population.

$$\frac{\text{Number of Divorces in Year}}{\text{Mid - year population in that same Year}} \times 1000$$

Notes on Tables and Charts - Symbols and Abbreviations

-	nil, none, zero, negligible		
%	Percentage		
CBR	Crude Birth Rate	ICD	(WHO's) Injuries and Causes of Death
CBR _F	Female Crude Birth Rate	IMR	Infant Mortality Rate
CBR _M	Male Crude Birth Rate	M	Male
CBR _T	Total Crude Birth Rate	N.A.	Not available
CDR	Crude Death Rate	No.	Number
CDR _F	Female Crude Death Rate	N.S.	Information is unavailable and therefore is Not Specified or Not Stated
CDR _M	Male Crude Death Rate

--	----

An aerial photograph of a crowded beach. The scene is filled with people of various ages, some sitting on towels or blankets, others standing. There are several colorful beach umbrellas scattered across the sand. The shadows of the people are cast long and dark, indicating it is either early morning or late afternoon. The overall atmosphere is busy and recreational.

Population & Vital Statistics Summary

Highlights the analysis of the estimated population and other indicators of live births, deaths, marriages and divorces.

Vital statistics summary

This section of the publication presents highlights of analysis of the estimated population and other vital indicators of live births, deaths, marriages, and divorces for the Turks and Caicos Islands (TCI) for the period 2001 to 2019. It should be noted that this publication gives an account mainly of events that physically occur and was recorded in the TCI.

The mid-year population of the TCI was estimated at 41,360 and 42,953 in 2018 and 2019, respectively. After significant growth between 2001 and 2008, the population contracted during the period 2009 to 2011. The population is currently experiencing growth but at a more controlled pace than the growth experienced over the period 2002 to 2009. This can be attributed to the controlled demand of foreign workers compared to the large number of foreign workers recruited between 2002 and 2007 to help meet the demands of the TCI labour market.

The number of live births in the TCI fluctuated over the period 2002 to 2019, with the largest number of live births (596) being recorded in 2009, compared to 153 live births recorded in 2002. The Turks and Caicos Islands recorded 487 live births in 2019. This was 7.0 percent higher than the 455 births recorded in 2018. A comparison of births by sex in table 2.2 reveals that in the most recent years (2013 – 2019) there were more male live births than female live births – 51.7 percent male live births versus 48.3 percent female live births. One should caution not to extrapolate that this natural increase in population should reflect on overall population growth by gender, since population growth is affected by net migration and deaths as well. CBR for females was higher than CBR for males in 2019 and both sexes recorded the same CBR (11.5) in 2013.

The number of deaths fluctuated over the period 2001 to 2019, with the highest number of deaths (125) being recorded in 2017. It must be pointed out that included in these deaths for the period under consideration are Haitian nationals who drowned in TCI waters as well as other visitors who would have died while in the TCI. Excluded from these deaths are TCI residents who would have died overseas. The lowest number of deaths (46) over the period 2001 to 2018 was recorded in 2004, compared to 122 deaths in 2019. Comparing the number of male and female deaths, it is evident that these too experienced an overall fluctuating trend. However, in general, there seems to be more male deaths than female deaths over the period under consideration. In 2019 there were 78 (63.9 percent) male deaths versus 44 (36.1 percent) female deaths; which is similar to the proportion of deaths in 2018 (60 or 58.8 percent male deaths and 42 or 41.2 percent female deaths). The highest disparity in the percentage of male to female deaths was recorded in 2007, when 65.5 percent were males to 33.6 percent of the deaths being females. This, was also the year in which the TCI recorded the third highest number of deaths (116). Similar disparities were evident in 2012, 2014 and 2015.

Data from the civil registry reveal that a total of 415 marriages were registered in 2019 compared to 464 marriages in 2018. During the period 1999 to 2016 the Turks and Caicos Islands has constantly recorded 400 or more marriages. However, in 2017 the TCI only recorded 295 marriages. This significant decline in the number of marriages in 2017 was mainly due to the passage of hurricanes Irma and Maria in September of that year and the closure of major hotel properties during the period September to December.

TABLE 1.1. POPULATION GROWTH & DENSITY: 1970 - 2020.

YEARS	Male	Female	Total Population	Population Growth Rate	Population Density
				(% CHANGE)	(per sq. mile)
1970	2,635	2,923	5,558	15.2
1980	3,580	3,833	7,413	33.4	20.2

Notes:

¹The figures exclude deaths of the islands' population which take place outside of the country.

* The figures do not include births to residents outside the TCI.

Included in this calculation are the death of immigrants from Haiti in TCI waters.

#Births

This section presents live births statistics in the TCI from 2001 to 2019 and other information on the mother such as: age, nationality and island of usual residence. It should be noted that live births considered in this report cover those that have occurred in the Islands and not overseas. It also captures only those births which occurred in the hospitals or if occurring outside the hospital was registered at the Registrar of Births Office.

BIRTHS

The number of live births in the TCI fluctuated over the period 2002 to 2019, with the largest number of live births (596) being recorded in 2009, compared to 153 live births recorded in 2002. Registered births numbered 487 in 2019 as compared to 455 registered births in 2018. This was 7 percent higher than the 455 births recorded in 2018. The crude birth rate of 11.3 per 1000 population is reflective of an increase in the rate achieved in the previous year of 11.0 per 1000 population in 2018. Despite the low figures achieved for births it should be noted that the registered births and crude birth rate over the period under consideration does not provide sufficient evidence to conclude that a downward trend exist in the childbearing experience of women in the Turks and Caicos Islands. The incidence of teenage pregnancies though small, is still a focus of attention in the society. Throughout the past decade and in an effort to postpone child-bearing and/or reduce fertility among potential teenage mothers, this age-group has seen targeted programs by the Gender Department.

A comparison of births by sex in table 2.2 reveals that in the most recent years (2013 – 2019) there were more male live births than female live births – 48.3 percent female live births versus 51.7 percent male live births. The highest number of male and female live births in the TCI occurred in 2009. These were 297 and 299 respectively. CBR for males were higher than CBR for females in 2018 and 2019 and both sexes recorded the same CBR (11.5) in 2013.

Table 2.3 organizes live births by age of mother for 2001 to 2019. A careful analysis of the data in this section indicates that most live births occurred when the mother was within what is considered the normal child-bearing age (15-49 years). The percentage distribution of births by age of mother occurring in 2018 and 2019 indicate that the number of births to mothers less than 20 years old has increased slightly from 23 in 2018 to 24 in 2019. The proportion of births to women aged 20-24 years was at 14.7 percent in 2018 and 15.8 percent in 2019. Births to women 25- 29 years amounted to 21.8 percent in 2018 and 23.8 percent in 2019. Births to women 30 – 34 years amounted to 29.7 percent in 2018 and 29.4 percent in 2019. Births to women 35 – 39 years amounted to 23.5 in 2018 and 20.3 percent in 2019. The summation of these three age groups 25 – 29, 30 – 34 and 35 – 39 accounted for 75.0 percent and 73.2 percent of total births in 2018 and 2019 respectively. The lowest birth rates were experienced in the 45 – 49 year age groups. In 2019, there was a total of 3 births by women in the 45-49 years' age group. Mean Age of Child bearing in 2019 was 30. In 2019, the average age of mother was 30.11 years as compared to 30.38 years in 2018. This figure remained relatively the same, however a very minimal increase of 0.27 was seen. In 2019, the modal child bearing age was 32 years. The minimum child bearing age was 15 years and the maximum child bearing age was 48 years in 2019.

BIRTHS

There seems to be no evident correlation of number of births and month of birth, as there seems to be a fluctuating pattern of live births by months in the two years under consideration. However, the trend that is evident in these years reflects that the highest number of live births recorded, is on the island of Providenciales (ranging from 71.3 percent in 2004 to 91.2 percent in 2019 – an increase of 19.9 percent) and then next the island of Grand Turk (ranging from 28.3 percent in 2004 to 8.8 percent in 2019). This is expected and is mainly due to the fact that Providenciales and Grand Turk are the most populated islands but is also as a result of mothers from the other islands giving birth on Grand Turk and Providenciales, which have hospital facilities, and a reasonable capacity of medical personnel.

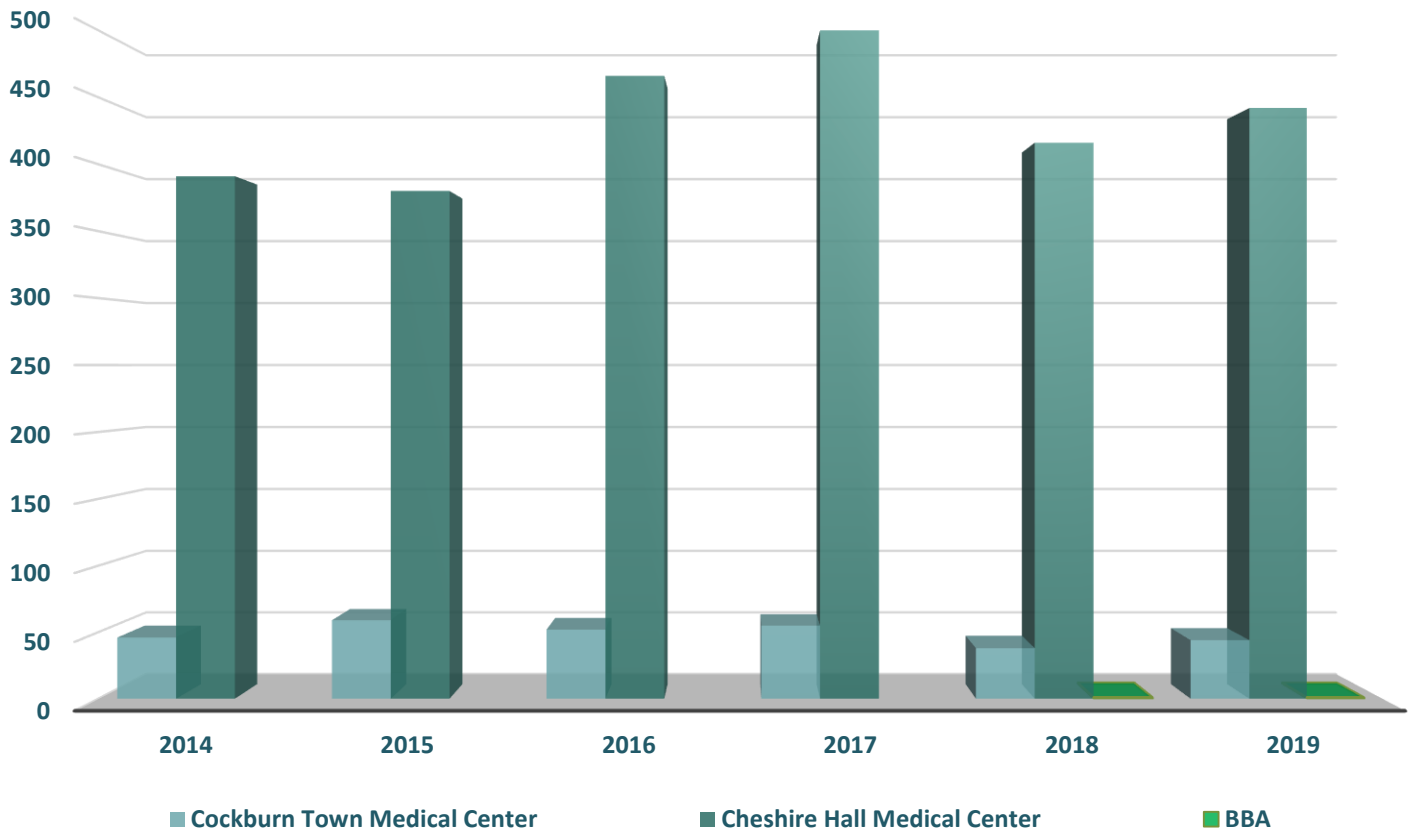

Tables 2.5 reflects live births by nationality for the period 2001 to 2019. A review of the data in this table shows that most births during this period were to Haitian nationals, followed by Turks and Caicos Islands nationals, with births to nationals from the Dominican Republic, Jamaica and Other Caribbean Countries following by a larger margin. During the period 2001 to 2019, there were approximately 7,956 live births in the TCI. From these live births 49.0 percent (3,901 of 7,956) of the live births were to Haitian nationals with 27.2 percent to nationals of the TCI (2,163 of 7,956); 9.8 percent (780 of 7,956) were from nationals of the Dominican Republic, and the remaining 14 percent of births to nationals of other countries.

A comparison of births by nationality for 2018 and 2019 reveal that 61.3 percent of the live births in 2018, were to Haitian nationals (279 of 455); while 20.2 percent were to TCI nationals (92 of 455); 7.5 percent and 4.6 percent respectively to nationals of the Dominican Republic and Jamaica, leaving only about 4.2 percent of live births to the other nationals. In contrast, 2019 data reveal that, 58.3 percent of the live births were to Haitian nationals (284 of 487); while 26.3 percent were to TCI nationals (128 of 487); 8.0 percent and 3.3 percent respectively to nationals of the Dominican Republic and Jamaica, leaving only about 4.1 percent of live births to the other nationalities. Noticeably, the number of live births to TCI nationals increased by 39.1 percent and births to Haitian nationals increased by 1.8 percent in 2019. It should be noted that these live births reflect only those which take place in the TCI and not births which occurred overseas.

#Deaths

This section presents the number of deaths in the country for the period 2006 to 2019.

DEATHS

On the other side of births and birth rates is deaths and death rates. Table 3.1 shows that the **number of deaths** fluctuated over the period 2001 to 2019, with the highest number of deaths (125) being recorded in 2017. It must be pointed out that included in these deaths for 2019, 2017 and in previous years are Haitian nationals who drowned in TCI waters as well as other visitors who would have died while in the TCI. Excluded from these deaths are TCI residents who would have died overseas. The lowest number of deaths (46) over the period 2001 to 2019 was recorded in 2004. When comparing the number of male and female deaths, it is evident that these too experienced an overall fluctuating trend. However, in general, there seems to be more male deaths than female deaths yearly. In 2019 there were 78 (63.9 percent) male deaths versus 44 (36.1 percent) female deaths; which is similar to the proportion of deaths in 2018 (60 or 58.8 percent male deaths and 42 or 41.2 percent female deaths). The highest disparity in the percentage of male to female deaths was recorded in 2007, when 65.5 percent were males to 33.6 percent of the deaths being females. This, was also the year in which the TCI recorded the third highest number of deaths (116). Similar disparities were evident in 2012, 2014 and 2015. It must be noted however that contributing to the number of male deaths in 2019 was the drowning of migrants in TCI waters.

The crude death rate (CDR) for the TCI is relatively low. After increasing to 3.07 deaths per 1,000 persons in 2017, it declined to 2.49 deaths per 1,000 persons in 2018 and increased to 2.84 deaths per 1,000 persons in 2019. In general, the CDR for males in the TCI for the period under consideration was higher than the CDR for females. CDR by sex reveals that the rate for males (2.84) was higher than the rate for females (1.64) in 2018, compared to a male CDR of 3.56 and a female CDR of 2.09, in 2019.

In terms of number of deaths by age group (see Table 3.5), approximately 60.7 percent (or 74) of the deaths in 2019 were to persons 50 years of age or older, compared to 59.8 percent (or 61) deaths in 2018. The evident pattern showing deaths by island is that more deaths occurred on the islands of Providenciales and Grand Turk. This is expected as these are the two most populated islands. No particular trend is evident in the month the deaths occurred. Figure 3.1 shows this erratic trend in deaths by month. In 2019, the highest number of deaths (22) occurred in the month of March versus the highest number of deaths (11) which also occurred in the month of March in 2018.. It must also be noted that the Haitian boat drownings contributed to the increase in the number of deaths in 2019.

In terms of the nationality of the deceased, Tables 3.14 to 3.16, reveal that 54.9 percent or 67 deaths in 2019 were to TCI nationals, 13.9 percent or 17 deaths were to Haitian nationals, 10.7 percent or 13 deaths were to American citizens, the rest were to other nationalities. The tables also show that there are more deaths among the older age groups despite the nationality of the deceased.

TABLE 3.1. NUMBER OF DEATHS WITHIN THE TCI: 1980, 1990 -2019.

YEAR	NO.	Percentage Change (%)
1980	21	(55.3)

#Marriages

ANALYSIS OF MARRIAGES IN THE TCI: 2006 TO 2019.

FIGURE 4.1: NUMBER OF MARRIAGES BY YEARS 2006 - 2019.

This section provides an analysis of marriages within the TCI for 2006-2019. Although detailed data is not available for 2013 and 2014, it should be noted that based on previous yearly trends over 80% of marriages performed in the TCI occur to visitors or non-residents who leave shortly after they wed and have no impact on the country's demography or social climate. Therefore, not much analysis was done on this section of the publication. Data from the civil registry however reveal that a total of 415 marriages were registered in 2019 compared to 464 marriages in 2018. It should be noted that for the period 2004 to 2019 the month of May recorded the most marriages in the TCI.

During the period 1999 to 2016 the number of marriages in the TCI has constantly been over 400. In 2017 the number of marriages recorded was 295. This significant decline in the number of marriages was mainly due to the passage of hurricanes Irma and Maria in September of that year. The highest number of marriages during the period 1999 to 2018 was recorded in 2006, 2010 and 2016 when 636, 632 and 621 marriages were recorded respectively.

When broken down by nationality, Table 4.15 shows that 54 percent of brides and 54 percent of grooms hail from the United States of America in 2019. In the same year TCI brides and grooms accounted for 8 percent and 11 percent respectively. It should be noted that as with other events in the TCI, some Islanders choose the USA and other countries as their wedding destination. Those events that occurred outside of the country are not captured in these tables.

Table 4.7 reveals that in 2019 the majority of TCI grooms got married to TCI, Dominican and Haitian brides. 45.5 percent of marriages of TCI grooms were to TCI brides, 15.9 percent were to Haitian brides and 15.9 percent were to Dominican brides. The rest were allocated to other nationalities.

Table 4.8 shows that of the majority of marriages involving TCI brides in 2019, 45.5 percent, were to TCI grooms, while 50.0 percent were to Haitian grooms, 33.3 percent were to Jamaican grooms and the other were to different nationalities.

TABLE 4.1: MARRIAGES CONTRACTED BY TCI AND NON TCI NATIONALS: 2006 – 2019.

Year	All Marriages	Marriages of Non-TCI Nationals	Marriages of TCI Nationals	Marriages of TCI Nationals as % of Total Marriages

A wooden gavel with a three-tiered head and a single handle, resting on a white document. The document has the words "DIVORCE DECREE" printed in a serif font, with a horizontal line above the word "DECREE". In the foreground, the top corner of a light-colored envelope is visible. The entire scene is set against a dark wood-grain background.

DIVORCE DECREE

#Divorces

This section shows the divorce statistics in the TCI. The divorces statistics included in this report are only those that were completed with the issuance of a “Decree Absolute” by the Court. It should be noted that in the divorce process, the “Decree Nisi” is the provisional divorce order issued by Court before the “Decree Absolute”. The couple will remain married until the “Decree Nisi” has been Absolute.

**TABLE 5.1. NUMBER OF DIVORCES
AND CRUDE DIVORCE RATE:
2001-2016.**

YEARS	FILED DIVORCES	FINAL DIVORCES	Completion Rate	Crude Divorce Rate

2016	54	36	66.7	0.9

Source: Divorce Division, Supreme Court

Note: Data prior to 2007 and 2008 included those that have been issued with Divorce Nisi only

The percentage of divorces that is classified as “final” has increased over the years. For the period 2011 to 2016 more than 50 percent of divorces filed were finalized. 2008 marked the lowest number and percentage of divorces completed (8 or approximately 14%) for the period 2001 to 2016. This was partly due to the delays in the divorce proceedings that happened in that year. It should also be noted that the Supreme Court, which handles divorce applications, was moved or occupied temporary offices since their building was destroyed by fire. This was followed by Hurricane Ike in September of 2008 which led to further delays. Hurricane Irma and Maria can also be considered an attributing factor in 2017.

During the period 2001 to 2016, more than three-quarters or 77.8 percent of finalized divorces occurred after 6 or more years of marriage. Forty-five percent (45%) of the finalized divorces in 2017 occurred after 9 years of marriage. In contrast, 66.7% of the divorces finalized in 2016 occurred after 10 or more years of marriage. Mostly, childless couples (48.9 percent) or those with two children (32.3 percent) had “finalized” divorces in 2016.

APPENDIX

This section contains additional information which could provide useful context or background materials and definitions.

GLOSSARY

CRUDE BIRTH RATE

A vital statistics summary rate based on the number of live births occurring in a population during a given period of time, usually a calendar year, i.e., the number of live births occurring among the population of a given geographical area during a given year, per 1,000 mid-year total population of the given geographical area during the same year.

CRUDE DEATH RATE

A vital statistics summary rate based on the number of deaths occurring in a population during a given period of time, usually a calendar year, i.e., the number of deaths occurring among the population of a given geographical area during a given year per 1,000 mid-year total population of the given geographical area during the same year.

CRUDE DIVORCE RATE

A vital statistics summary rate based on the number of divorces occurring in a population during a given period of time, usually a calendar year, i.e., the number of divorces occurring among the population of a given geographical area during a given year per 1,000 mid-year total population of the given geographical area during the same year.

CRUDE MARRIAGE RATE

A vital statistics summary rate based on the number of marriages occurring in a population during a given period of time, usually a calendar year, i.e., the number of marriages occurring among the population of a given geographical area during a given year per 1,000 mid-year total population of the given geographical area during the same year.

DEATH

Death is the permanent disappearance of all evidence of life at any time after live birth has taken place (post-natal cessation of vital functions without capability of resuscitation). This definition excludes foetal deaths (see FOETAL DEATH).

DIVORCE

Final legal dissolution of a marriage; a separation of husband and wife that confers on the parties the right to remarriage under civil, religious and/or other provisions in accordance with the laws of the country.

FOETAL DEATH

The death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the period of gestation; the death is indicated by the fact that after such separation, the foetus does

not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.

INFANT DEATHS

Deaths of live-born children under one year of age.

INFANT MORTALITY RATE

A vital statistics summary rate based on the number of infant occurring during the same period of time, usually a calendar year, i.e., the number of deaths under one year of age occurring in a given geographical area during a given year, per 1,000 live births occurring among the population of the given geographical area during the same year.

LIVE BIRTH

A live birth is the result of the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which after such separation breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered to be live-born.

MATERNAL DEATH

A maternal death is the death of a woman while pregnant or within 42 days after the termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes.

MATERNAL MORTALITY RATE

A vital statistics rate based on the number of deaths due to maternal causes relative to the number of live births occurring during a given period of time, usually a calendar year, i.e., the number of deaths to women resulting from (a) direct obstetric complications of pregnancy, labour and the puerperium, (b) from interventions, omissions or incorrect treatments or their results, or (c) from indirect obstetric causes resulting from previously existing disease or disease arising during pregnancy and which was not due to direct obstetric causes but which was aggravated by the physiological effects of the pregnancy, occurring in a given geographical area during a given year per 100,000 (or 10,000) live births occurring in the given geographical area during the same year.

POPULATION

(1) All the inhabitants of a given country or area (province, city, metropolitan area etc.) considered together; the number of inhabitants of a country or area. (2) In sampling, the whole collection of units (persons, households, institutions, events etc.) from which a sample may be drawn.

VITAL EVENT

The occurrence of a live birth, death, foetal death, marriage, divorce, adoption, legitimation, recognition of parenthood, annulment of marriage or legal separation.
